UNMANNED AERIAL SYSTEMS

Capabilities Statement — Aircraft, Operations, Training, Site Security & Integration

We supply, build, and operate unmanned aircraft systems for clients who need aerial capability delivered as a working result rather than a box of hardware — platform procurement across multiple manufacturers, custom airframe and payload builds where no commercial product fits the mission, operator training, and fully crewed flight operations. Aerial assets are integrated into existing security, communications, and data infrastructure, including remote, austere, and hostile environments where support is limited and reliability is non-negotiable.

AIRCRAFT & PLATFORMS

- VTOL fixed-wing platforms for long-endurance, long-range coverage
- Multirotor and hybrid airframes for close-in and confined-area work
- Multi-supplier sourcing — platform matched to mission, not to one vendor line
- Day/night EO-IR, thermal, multispectral, LiDAR, and mapping payloads
- Ground control stations, comms kits, spares and field-repair packages

CUSTOM BUILDS & ENGINEERING

- Purpose-built airframes for payload, endurance, and environmental requirements
- Payload integration, gimbal and sensor mounting, mechanical and electrical fabrication
- Flight controller and autopilot configuration, tuning, and airframe validation
- Onboard compute and edge processing for detection, tracking, and real-time analysis

TRAINING & CREW DEVELOPMENT

- Operator and instructor courses from basic airmanship through mission qualification
- Platform-specific transition and payload operator training
- Mission planning, crew coordination, and standardized flight procedures
- Maintenance, preflight, and field-service training for client technicians
- Programs of instruction, checklists, and SOPs the client retains

FLIGHT OPERATIONS

- Contract aircrew providing turnkey operations — we plan, fly, and deliver product
- Persistent surveillance, patrol, and overwatch of fixed sites and moving assets
- Search and rescue, damage assessment, and emergency response support
- Survey, mapping, inspection, and change-detection missions
- Deployable field kits sized for vehicle, aircraft, or single-operator movement

SITE SECURITY PROGRAMS

- Aerial security planning for remote, fixed, linear, and unattended infrastructure
- Site survey, threat and vulnerability assessment, coverage and sensor placement
- Response procedures, escalation paths, and reporting formats built into the plan
- Airspace awareness and unauthorized-UAS detection integrated with ground security
- Operations in permissive through hostile and limited-support environments

INTEGRATION & SUSTAINMENT

- Aerial sensor feeds integrated into existing command and monitoring systems
- Common operating picture and situational-awareness output to established platforms
- Communications and data links suited to available infrastructure or none at all
- Data handling, processing, storage, and delivery in client-specified formats
- Fleet support: maintenance, repair, spares provisioning, readiness tracking

CUSTOM MULTIROTOR BUILD

VTOL FIXED-WING, FIELD SITE

LONG-ENDURANCE VTOL

AUSTERE-SITE OPERATIONS

FORWARD-FLIGHT TRANSITION

Hardware, aircrew, training, and integration from one source — delivered as a working capability, supported after handover.
